PLSC 503 – Spring 2020
Multivariate Regression II

February 6, 2020

Inference, In General

- Pick some $\mathbf{H}_A : \boldsymbol{\beta} = \boldsymbol{\beta}_A$
- Estimate $\hat{\boldsymbol{\beta}}$
- Determine distribution of $\hat{\boldsymbol{\beta}}$ under $\mathbf{H}_A$
- Form a *test statistic* $\hat{\mathbf{S}} = h(\boldsymbol{\beta}, \hat{\boldsymbol{\beta}})$
- Assess $\Pr(\hat{\mathbf{S}}|\mathbf{H}_A)$

The Importance of $\mathbf{V}(\hat{\boldsymbol{\beta}})$

$$\begin{aligned}
\mathbf{V}(\hat{\boldsymbol{\beta}}) &= \mathsf{E}[\hat{\boldsymbol{\beta}} - \mathsf{E}(\hat{\boldsymbol{\beta}})]^2 \\
&= \mathsf{E}\{[\hat{\boldsymbol{\beta}} - \mathsf{E}(\hat{\boldsymbol{\beta}})][\hat{\boldsymbol{\beta}} - \mathsf{E}(\hat{\boldsymbol{\beta}})]'\}
\end{aligned}$$

Rewrite:

$$\begin{aligned}
\mathbf{V}(\hat{\boldsymbol{\beta}}) &= \mathsf{E}(\hat{\boldsymbol{\beta}} - \boldsymbol{\beta})(\hat{\boldsymbol{\beta}} - \boldsymbol{\beta})' \\
&= \mathsf{E}\{[(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{u}][(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{u}]'\} \\
&= \mathsf{E}[(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{u}\mathbf{u}'\mathbf{X}(\mathbf{X}'\mathbf{X})^{-1}]
\end{aligned}$$

The Importance of $\mathbf{V}(\hat{\beta})$

Taking expectations:

$$\begin{aligned}
\mathbf{V}(\hat{\beta}) &= (\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathrm{E}(\mathbf{u}\mathbf{u}')\mathbf{X}(\mathbf{X}'\mathbf{X})^{-1} \\
&= (\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\sigma^2\mathbf{I}\mathbf{X}(\mathbf{X}'\mathbf{X})^{-1} \\
&= \sigma^2(\mathbf{X}'\mathbf{X})^{-1}
\end{aligned}$$

Estimating $\mathbf{V}(\hat{\boldsymbol{\beta}})$

Empirical estimate:

$$\hat{\sigma}^2 = \frac{\hat{\mathbf{u}}'\hat{\mathbf{u}}}{N - K}$$

Yields:

$$\widehat{\mathbf{V}(\hat{\boldsymbol{\beta}})} = \hat{\sigma}^2(\mathbf{X}'\mathbf{X})^{-1}$$

Single Coefficient Hypothesis Tests

$$\hat{\boldsymbol{\beta}} \sim \mathcal{N}[\boldsymbol{\beta}, \sigma^2(\mathbf{X}'\mathbf{X})^{-1}]$$

In practice, using $\hat{\sigma}^2$ means

$$\hat{\boldsymbol{\beta}} - \boldsymbol{\beta} \sim \mathfrak{t}_{N-K}$$

Procedure:

- Choose a value of β_k that you want to test (say, $\beta_k = 0$),
- Calculate the t-statistic for the coefficient associated with X_k, which is:

$$\hat{t}_k = \frac{\hat{\beta}_k - \beta_k}{\sqrt{\widehat{\mathbf{V}(\hat{\beta}_k)}}}$$

- Compare $\hat{t}_k$ to a t distribution with $N - K$ degrees of freedom.

Multivariate Hypothesis Testing

E.g.: $\quad \mathsf{H}_0 : \beta_1 = \beta_2 = ... = \beta_K = 0$

or: $\quad \mathsf{H}_0 : \beta_3 = \beta_6 = 0$

Generally: *Linear restrictions*:

$$\underset{q \times k}{\mathbf{R}} \underset{k \times 1}{\boldsymbol{\beta}} = \underset{q \times 1}{\mathbf{r}}$$

E.g.:

$$\beta_2 = -2 \iff (0\ 1\ 0) \begin{pmatrix} \beta_1 \\ \beta_2 \\ \beta_3 \end{pmatrix} = -2$$

The F-test

Recall:

$$\textbf{TSS} \quad = \quad \textbf{MSS} \quad + \quad \textbf{RSS}$$

Consider:

$$Y_i = \beta_0 + \beta_1 X_{1i} + \beta_2 X_{2i} + \beta_3 X_{3i} + \beta_4 X_{4i} + u_{Ui}$$

and the restriction:

$$\mathrm{H}_a : \beta_2 = \beta_4 = 0.$$

Restricted model:

$$\begin{aligned} Y_i &= \beta_0 + \beta_1 X_{1i} + 0 X_{2i} + \beta_3 X_{3i} + 0 X_{4i} + u_i \\ &= \beta_0 + \beta_1 X_{1i} + \beta_3 X_{3i} + u_{Ri} \end{aligned}$$

F-tests: Sums of Squared Residuals

"Unrestricted":

$$\mathrm{RSS}_U \equiv \hat{\mathbf{u}}_U' \hat{\mathbf{u}}_U = \sum_{i=1}^{N} \hat{u}_{Ui}^2$$

"Restricted":

$$\mathrm{RSS}_R \equiv \hat{\mathbf{u}}_R' \hat{\mathbf{u}}_R = \sum_{i=1}^{N} \hat{u}_{Ri}^2$$

F-statistic:

$$\mathbf{F} = \frac{(\mathrm{RSS}_R - \mathrm{RSS}_U)/q}{\mathrm{RSS}_U/(N-K)}$$

$$= \frac{(R_U^2 - R_R^2)/q}{(1-R_U^2)/N-K}$$

Testing:

$$\mathbf{F} \sim F_{q,N-K}$$

F-Test: Example

Consider:

$$\begin{aligned} \mathrm{H}_b : \quad & \beta_1 + \beta_4 = 1 \\ & \beta_1 = 1 - \beta_4 \end{aligned}$$

Implies:

$$\begin{aligned} Y_i &= \beta_0 + (1 - \beta_4)X_{1i} + \beta_2 X_{2i} + \beta_3 X_{3i} + \beta_4 X_{4i} + u_{R'i} \\ &= \beta_0 + X_{1i} - \beta_4 X_{1i} + \beta_2 X_{2i} + \beta_3 X_{3i} + \beta_4 X_{4i} + u_{R'i} \\ &= \beta_0 + X_{1i} + \beta_2 X_{2i} + \beta_3 X_{3i} + \beta_4 (X_{4i} - X_{1i}) + u_{R'i} \end{aligned}$$

implying restricted model:

$$Y_i - X_{1i} = \beta_0 + \beta_2 X_{2i} + \beta_3 X_{3i} + \beta_4 (X_{4i} - X_{1i}) + u_{R'i}$$

Confidence Regions

$$F = \frac{(\hat{\boldsymbol{\beta}}_q - \boldsymbol{\beta}_q^H)'\hat{\mathbf{V}}_q^{-1}(\hat{\boldsymbol{\beta}}_q - \boldsymbol{\beta}_q^H)}{q\hat{\sigma}^2}$$

Implies:

$$\Pr\left[\frac{(\hat{\boldsymbol{\beta}}_q - \boldsymbol{\beta}_q^H)'\hat{\mathbf{V}}_q^{-1}(\hat{\boldsymbol{\beta}}_q - \boldsymbol{\beta}_q^H)}{q\hat{\sigma}^2} \leq F_{q,N-K}\right] = 1 - \alpha. \quad (1)$$

$\rightarrow$ "confidence region" of all points satisfying:

$$(\hat{\boldsymbol{\beta}}_q - \boldsymbol{\beta}_q^H)'\hat{\mathbf{V}}_q^{-1}(\hat{\boldsymbol{\beta}}_q - \boldsymbol{\beta}_q^H) \leq q\hat{\sigma}^2 F_{q,N-K}.$$

$$\hat{Y}_j = \mathbf{X}_j\hat{\boldsymbol{\beta}}$$

Variance:

$$\widehat{\mathbf{V}(\hat{Y}_j)} = \hat{\sigma}^2[1 + \mathbf{X}_j(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}_j']$$

Standard error:

$$\widehat{\text{s.e.}(\hat{Y}_j)} = \sqrt{\hat{\sigma}^2[1 + \mathbf{X}_j(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}_j']}$$

Example: Africa Data

```
> library(RCurl)
> temp<-getURL("https://raw.githubusercontent.com/PrisonRodeo/PLSC503-2020-git/master/Data/africa2001.csv"
> Data<-read.csv(text=temp, header=TRUE)
> Data<-with(Data, data.frame(adrate,polity,
+           subsaharan=as.numeric(subsaharan),muslperc,literacy))
